HYSTEROSONOGRAM

A method of producing ultrasound images to evaluate the lining (endometrium) of the uterus. This study is performed for abnormal or excessive bleeding or for infertility studies.

Your doctor has ordered an ultrasound examination of your uterus. In order to see your uterus, the Radiologist will insert a speculum, and then a catheter into your cervix. Saline will then be introduced through this catheter. The average time required for this procedure is one hour.

To ensure the success of this procedure and that you are not pregnant, please follow the instructions below:

1.) The exam should be performed when you have stopped bleeding, usually between day seven and ten following the first day of your menstrual cycle.

2.) No sexual intercourse between day one (1) of your menstrual cycle and the day of the exam.

3.) Report to the X-ray Department Middle Entrance of the Specialty Center.
